Consultant Endocrinologist & Diabetologist

Tehseen Tahira Jawa

65 Years Female

Visit Date: 23-Feb-2021

Appointment Type: Online

Vitals: **SBP/DBP** 140/80 mmHg **Pulse** 78

Patient presented to the ED with absolute constipation of 2 days and acute abdominal pain of one day, on Monday evening 8 PM (February 22, 2021). She was given Ketorolac and Nalbuphine injections in tandem, as well as IV fluids. Her pain subsided from 9/10 to 2/10. She needed overnight parenteral analgesic as well as in the later morning. She has not passed any stool till now. On exam, there is a doughy mass in LLQ.

USG of the abdomen: There is mild free fluid in the left side of the abdomen. Gut loops are dilated more on the right side, suggesting intestinal obstruction. There is a mass 10 x 5 cm in the mid abdomen just above the umbilicus most likely arising from the intestine with wall thickness measure 1.0 cm and polypoidal growth in it measures 4.8 x 2.2 cm. Pancreas, kidneys, urinary bladder and liver are normal.

KUB X-ray shows multiple air fluid levels, consistent with intestinal obstruction.
